

TIRENIFY

Product Roadmap & Strategic Vision

Phase 1–5+ (2026–2030+)

Daniel Adeleye · Founder · Akure, Nigeria · June 2026

Confidential — Prepared for investor review

EXECUTIVE SUMMARY

Tirenify is building a security company for 1 billion+ Africans online. The company is structured in phases, each solving a specific user problem and unlocking revenue opportunities. This roadmap spans 5+ years, moving from awareness (Phase 1) to enterprise (Phase 4) and beyond. This is not a quick product flip. This is a company built to last and scale.

WHY THIS ROADMAP EXISTS

The Problem

African internet users face daily security threats — SIM swaps, BVN leaks, phishing, account takeovers. Yet there is no affordable security product built for them. Western security companies (Experian, LifeLock, Norton) ignore Africa because the market is too small for their profit margins. Local alternatives don't exist.

The Opportunity

Build a security company in Africa, for Africa, solving problems no one else is solving. Start with the highest-impact, lowest-friction problem (breach awareness), then expand into monitoring, protection, and enterprise.

The Thesis

- Solve Real, Urgent Problems — Users get breached daily; they need immediate solutions
- Build Deep Market Understanding — Competitors lack African context and infrastructure knowledge
- Establish Trust and Brand Early — First-mover advantage in an underserved market
- Create Defensible Moat — Deep African expertise that Western companies cannot replicate
- Scale Globally When Proven — Proven product in hardest market becomes unstoppable globally

PHASE 1: EMAIL BREACH AWARENESS

Status: LIVE | Timeline: March 2026 – December 2026

The Problem I'm Solving

Users don't know if their data has been compromised in breaches. When a breach happens (Facebook, Equifax, LinkedIn, Twitter, Ticketmaster), millions of African emails are exposed. But users never find out. Attackers use their credentials elsewhere. They wake up to stolen accounts, fraudulent charges, identity theft, and compromised personal information. The Pain: Reactive. By the time users know, damage is done.

Phase 1 Solution

Free, instant email breach checker: input your email address, learn which breach databases contain your data, get actionable next steps (change password, enable 2FA). No signup required. No data tracking or storage.

Why This Phase First

Reason	Benefit
Lowest Friction	No account creation, works in 10 seconds
Highest Impact	Solves the awareness problem (foundation for everything else)
Fastest Learning	Real users testing real value proposition immediately
Sustainable Growth	Free users become premium customers in Phase 2
Market Validation	Proves demand before building expensive features

Phase 1 Features

- Email Breach Checker — Scan 10+ major breach databases (Equifax, Facebook, LinkedIn, Twitter, Yahoo, Dropbox, Adobe, etc.)
- Password Strength Analyzer — Detect if password appears in known leaks
- Phishing Awareness Tips — Educate users on spotting phishing emails
- Digital Footprint Summary — Show overview of exposure across platforms
- Freemium Model — Free tier for all, optional premium features

User Growth Targets

Month	Target Users	Reasoning
July	50 users	Organic launch, early adopters
August	150 users	Paid ads begin, organic grows
September	400 users	Ads optimize, word-of-mouth increases
October	800 users	Momentum building, brand awareness

November	1,500 users	Pre-Phase 2 surge, beta teasing
December	2,500+ users	Strong foundation for Phase 2 launch

Retention Target: 40%+ monthly retention by December

Revenue Target: #0 — Phase 1 is awareness, not monetization. Revenue comes in Phase 2.

Success Metrics

- ✓ 2,500+ active users by December 2026
- ✓ 40%+ monthly retention (users return)
- ✓ User feedback validating Phase 2 problems
- ✓ 10,000+ breach checks performed
- ✓ Zero security breaches or trust issues

Constraints During Phase 1

- Building solo (no team, no co-founder)
- Zero capital (free infrastructure, manual operations)
- Limited data access (using free/public breach databases)
- Limited marketing (organic Twitter, Reddit, WhatsApp only)
- Limited infrastructure (free tiers have constraints)

These constraints force creativity and lean execution.

PHASE 2: REAL-TIME ALERTS & MONITORING

Timeline: January 2027 – June 2027 | Launch: 6 months after Phase 1

The Problem I'm Solving

Phase 1 tells users 'You're breached,' but it's reactive. By the time users know, attackers may already have access. Users need proactive protection: Real-time Alerts (notification within hours of new breaches), Dark Web Monitoring, SIM Swap Detection, and BVN Exposure Alerts.

Phase 2 Solution: Premium Subscription

- Real-Time Breach Alerts — Scan new breaches hourly; alert user within minutes with actionable immediate response
- Dark Web Monitoring — Daily dark web scans; detect if email/phone/data is being sold; alert before compromised data is used
- SIM Swap Detection — Monitor for SIM swap attempts (unique to African market); prevent account takeover via SIM swap
- BVN Exposure Alerts — Monitor for Nigerian BVN leaks; alert if BVN appears in breaches; prevent identity theft

Premium Pricing

#1,000/month (~£0.55) OR #10,000/year (~£5.48) — approximately 80% cheaper than Western alternatives (LifeLock, Experian), and built for African context.

User Growth & Revenue Targets

Month	Total Users	Premium Users	Monthly Revenue
January	3,500	50	#50K
February	4,500	100	#100K
March	5,500	150	#150K
April	6,500	200	#200K
May	7,500	300	#300K
June	8,500+	425	#425K+

Success Metrics

- ✓ 8,500+ total users
- ✓ 400+ premium subscribers
- ✓ #300K+/month recurring revenue
- ✓ 60%+ churn reduction (premium users stay longer)
- ✓ 30% of Phase 1 users upgrade to premium

Key Hire: Korede (Prospective Backend Engineer)

Phase 2 requires real-time data feeds, dark web scrapers, alert systems, database optimization, and payment processing (subscription billing). This is a full-time backend engineering role. Korede has been identified as the prospective hire to own this layer — freeing the founder to focus on growth, product direction, and market expansion.

What Phase 2 Proves

- ✓ Users will pay for real-time security monitoring
- ✓ African market can sustain recurring revenue
- ✓ Product-market fit exists (users upgrade)
- ✓ Company is self-sustaining (#300K/month revenue can pay team)
- ✓ Business model is viable (not dependent on external funding)

PHASE 3: DATA REMOVAL & FAMILY COVERAGE

Timeline: 2028–2029

The Problem I'm Solving

Phase 2 tells users 'You're exposed' and alerts them. But users still can't do anything except change passwords. They can't remove their data from breached databases. They can't protect family members. The Gap: Users need action, not just alerts.

Phase 3 Solution

- Data Removal Service — Submit removal requests to breached companies/sites on behalf of user; automates GDPR and NDPR compliance
- Family Account Management — One account covers entire household (parents, kids, spouse); centralized dashboard; parents get visibility into children's exposure
- Account Audit Service — Review user's accounts; identify weak passwords and missing 2FA; track security posture over time

Household Plan Pricing: \$2,000/month (covers 5–10 family members) — 2× the price of individual premium, 10× the value.

User Growth & Revenue Targets

Total Users by end of 2029	20,000+
Household Plans	5,000+ (25% of user base)
Individual Premium	15,000 (75% of user base)
Individual Premium MRR	\$500K+
Household Premium MRR	\$500K+
Total MRR	\$1M+/month

PHASE 4: ENTERPRISE & B2B

Timeline: 2029–2030+

The Problem I'm Solving

Individuals and families are protected. But businesses in Africa have no security partner. Banks face daily security threats. Fintech startups have zero security infrastructure. Payment processors fear data leaks. E-commerce platforms worry about customer fraud. Western tools don't understand African context. B2B is where the real money is.

Phase 4 Solution

- Enterprise Dashboard — View employee security across company; track compliance; generate compliance reports
- Executive Tier — VIP monitoring for C-suite with priority alerts and dedicated support
- API Access — Let partners integrate Tirenify into their apps; banks show customers a 'Your data is safe' badge (via Tirenify)
- White-Label Partnerships — Integrate with banks, payment processors, fintech; revenue share model
- Compliance Reporting — Auto-generate GDPR, NDPR, and banking regulation reports

Enterprise Pricing

Segment	Size	Monthly Price
Small Business	10–100 employees	#50K/month
Mid-Market	100–1,000 employees	#200K+/month
Enterprise	1,000+ employees	#500K+ custom

Revenue Targets

50 enterprises × avg #40K	#2M+/month
API partnerships	#1M+/month
Total	#3M+/month

PHASE 5+ (2030 ONWARDS)

After Phase 4 is stable and generating #3M+/month recurring revenue.

Hardware Products

- Tirenify security devices (custom hardware)
- Hardware wallets for crypto (if market demands)
- Security dongles, biometric devices

Services

- Security consulting for enterprises
- Incident response teams
- Managed security services (24/7 monitoring)

Agile Response

Not locked into pre-planned roadmap. Respond to market feedback in real-time. Build whatever users say they need.

WHY AFRICA FIRST (STRATEGIC RATIONALE)

Build in Africa → Prove product in hardest market → Go global with defensible advantage.

Timeline

2026–2028	Build and prove in Africa
2028–2030	Expand to South Asia, Southeast Asia, Latin America
2030–2035	Global security company

Market Context

- 1 billion+ African internet users
- Near zero local security companies
- Western companies haven't cracked this market
- First-mover can establish unbreakable position
- Similar underserved markets: South Asia (1B+ users), Southeast Asia (500M+), Latin America (300M+)

ROADMAP DEPENDENCIES & RISKS

Risk	Probability	Mitigation
User Acquisition Slows	Medium	Partner with banks, telecom, fintech; leverage SMS/USSD for basic phones; adjust messaging from real user feedback.
Monetization Doesn't Work	Low	Test pricing early (start #500, increase to #1,500); offer family plans at #2,000; partner with employers to sponsor employee premium.
Regulatory Issues	Low	Build compliance into product from day one; work cooperatively with regulators; join industry associations; maintain model flexibility.
Competition Emerges	Medium	Move fast; build brand loyalty before competitors arrive; focus on African-specific features; build bank and payment processor partnerships as moat.
Key Team Member (Korede) Leaves	Medium	Cross-train team members; document code and processes; maintain strong culture and compensation; have backup developers identified.
Capital Runs Out	Low	Build for profitability from Phase 2; control spending tightly; target #300K/month by December (self-sustaining); maintain contingency plan.

TIMELINE SUMMARY

Phase	Timeline	Problem Solved	Users	Revenue	Outcome
Phase 1	Mar–Dec 2026	Awareness	2,500	#0	Product-market fit
Phase 2	Jan–Jun 2027	Monitoring	8,500	#300K+/mo	Self-sustaining
Phase 3	2028–2029	Action (Remove Data)	20,000	#1M+/mo	Family adoption
Phase 4	2029–2030+	Enterprise	50+ companies	#3M+/mo	Institutional ready
Phase 5+	2030+	Innovation	1B+ global	TBD	Tech leader

CONCLUSION

This roadmap is not wishful thinking. It is a realistic path from where Tirenify is today (0 users, #0 revenue, solo founder) to where it could be (major African tech company). Each phase solves a real, urgent problem; unlocks revenue; builds on the previous phase; de-risks the next phase; and stays focused and lean.

The market is waiting. The problems are real. The opportunity is massive. It's time to build.
