

WHY THIS PITCH EXISTS

My Conviction, Reasoning, and Belief in Tirenify

By Daniel Adeleye · June 2026

INTRODUCTION

This document explains why I created the Tirenify pitch website and why I'm reaching out to Simon Squibb specifically. It's not just a request for capital. It's an explanation of my thinking about entrepreneurship, Africa, and the problems worth solving.

I want Simon — and anyone reading this — to understand not just what I'm building, but why I'm willing to build it despite having almost no resources.

WHY SIMON SQUIBB CAUGHT MY ATTENTION

I saw Simon's TikTok content where he asks random people: 'What's your dream?' Most people brush him off. But some stop. Some share their dreams. Some share their obstacles. And Simon — without needing to, without obligation — offers to fund them. No pitch deck. No business plan. No lengthy application. Just: here's capital. Go execute.

What Struck Me

Not the money. The philosophy. Simon's asking something most people don't ask: What do people actually want to build? What are they held back by? And he's operating from a belief: The best ideas don't come from people who have everything. They come from people who have conviction despite having nothing. I am that person.

Simon's Philosophy — As I Understand It

- Building is better than studying for a degree
- Solving real problems matters more than credentials
- Constraints force innovation
- First-movers in underserved markets win big
- Young people have advantages (speed, fewer obligations, fresh perspective)

I believe all of that. And I'm living it.

WHY ENTREPRENEURSHIP IS MY PATH

I am 18. I am at university (FUTA, studying Industrial Engineering). I built a working product with zero capital, while studying, while freelancing to survive.

Most people would say: 'Finish university first. Get a job. Then start a company when you have money and stability.' I'm saying: No. I'm starting now. I'm learning faster by building than by sitting in

classrooms.

Why Tirenify Exists

- I saw a problem: 1 billion+ Africans online with zero affordable security tools
- I had conviction: This problem is real and solvable
- I started building: Instead of waiting for permission, funding, or ideal conditions

Entrepreneurship is not a career choice for me. It's the only path that makes sense.

WHY AFRICA NEEDS PRODUCTS BUILT BY AFRICANS

Every time an African problem needs solving, a Western company builds the 'solution.' LifeLock builds for America. Experian builds for America. Even banks in Africa use American security frameworks. Microsoft's Defender doesn't understand SIM swap fraud (unique to Africa). Google's password manager doesn't integrate with MTN Mobile Money. But African problems are different. Our infrastructure is different. Our payment systems are different. Our threats are different.

Concrete Example: Breach Checking

Dimension	Western Breach Checker	Tirenify
Internet access	Assumes fast, unlimited internet	Works on slow, expensive internet (#50/GB)
Payments	Reliable credit card (Stripe)	Bank transfer, mobile money, USSD, crypto
Language	English-speaking user assumed	Operates in 50+ languages
Email providers	Western providers assumed	Handles Nigerian bank and telecom email systems
Payment processors	Stripe	Flutterwave, Paystack
Threat coverage	Generic credential attacks	SIM swap fraud, BVN leaks — Africa-specific

Western companies don't build this because Africa is too small for their profit margins. But for me, it's the entire market. That's my advantage.

HOW TIRENIFY FITS INTO MY LONG-TERM VISION

Tirenify is my 10-year vision. Maybe 20-year vision.

Period	Focus
Years 1–3	Breach awareness, real-time monitoring — establish brand as Africa's security company

Years 3–5	Family protection plans, household coverage, data removal services
Years 5–10	B2B partnerships with African banks, payment processor integrations, enterprise dashboards
Years 10+	Custom security devices, hardware wallets, new security infrastructure

This isn't just a company. It's a movement.

WHY THIS MATTERS TO ME

My father died four years ago.

He was the primary income earner in our family. Before he passed, it was fair to say we were living comfortably — probably a little above average. Life wasn't perfect, but there was stability, security, and a sense that the future was already mapped out. When he died, that changed.

To be clear, I'm not saying this for pity. In fact, I hate being pitied. My family is okay. We've endured, adapted, and continued moving forward. But I'd be lying if I said I don't sometimes wonder what life would look like if he were still here.

The reason I mention this is because it shaped how I think.

After he passed away, most people probably assumed our family's story would be ordinary from that point forward. Finish school. Get a job. Live a normal life. There would be nothing wrong with that path. But I've never been able to think that way.

When I talk about my ambitions, my mother sometimes thinks I'm crazy. My roommate thinks I'm a dreamer. Honestly, I understand why. Some of the things I want to achieve sound unrealistic, even to me. But every meaningful achievement begins as something unrealistic.

I'm the first child in my family, and I feel a responsibility that goes beyond simply building a successful career for myself. If I can create a path that nobody in my family has walked before, my younger siblings won't have to wonder whether bigger things are possible. They'll be able to see it. That's part of why I build.

Tirenify isn't just a startup to me. It's proof that your circumstances don't have to define your future. It's proof that someone can start with limited resources, from a place most people overlook, and still build something that matters. More importantly, it's proof to myself that I refused to accept limitations placed on me by circumstance.

I refuse to fail. Not because failure is impossible, but because quitting isn't an option. As long as I keep building, Tirenify stays alive. It may evolve. It may take longer than expected. It may require multiple attempts and difficult lessons. But as long as I keep building, the mission stays alive.

I want to build something that outlives me. I want to build something that genuinely improves people's lives. I want to build a company whose name represents safety, trust, and peace of mind. And if I succeed, I hope it opens doors not only for me, but for the people coming after me.

I'm building this regardless. Any investment, mentorship, or partnership doesn't create the mission. It simply allows me to move faster.

WHY I'M WILLING TO BUILD DESPITE LIMITED RESOURCES

Right now, I have almost no money. My \$50K semester budget is gone. My freelance income barely covers survival. I'm stressed about money constantly. But I'm still building. Because the alternative is worse.

Why Struggle Is an Asset

Most founders have:	Safety net, elite education, family connections, years of savings
I have:	Hunger (no safety net), conviction (no other option), creativity (constraints force it), urgency (every day matters)

Constraints force creativity. Hunger motivates. When I don't have money for ads, I learn to get users organically. When I don't have a team, I learn to be scrappy and self-sufficient. When capital comes, I will be 10× more efficient than someone who always had it.

WHY THIS PITCH MATTERS

This isn't just asking for money. This pitch is me saying: I see a problem that billions of people face. I've built a solution. I'm executing despite having almost no resources. I'm willing to work for years to make this real. I'm willing to sacrifice comfort and stability to build something that matters. But I could move 10× faster with capital. Will you believe in this vision?

What I'm Actually Asking Simon For

Ask	Detail
Capital	\$2–5M to accelerate product development and the hire of Korede (prospective backend engineer)
Belief	Validation that this problem matters and is solvable
Mentorship	Guidance from someone who has built before
Credibility	Simon's backing opens doors in ways I can't

The money is the least important part. I could probably survive and build Tirenify on freelance income alone — it would take 2–3× longer, but it would still happen. What I really need is: someone who believes.

WHY AFRICA IS MY COMPETITIVE ADVANTAGE

Advantage	Why It Matters
I live here.	I understand problems Western founders don't. I use slow internet. I use mobile money. I know what payment systems work.

I'm young.	I don't have the baggage of 'how things are done.' I don't think: security companies need #100M to launch.
I'm hungry.	I have no safety net. I have to win. I can't afford to build mediocrely and hope someone buys it.
I'm local.	I can iterate with real users daily. I can see what works and what doesn't in real-time.
I'm lean.	I don't need #100K/year to live. I can operate efficiently with capital.

WHAT SUCCESS LOOKS LIKE FOR ME

Goal	What It Means
50M+ Africans using Tirenify by 2035	From Nigerian students to South African professionals to Kenyan entrepreneurs — all using a product I built
Tirenify as trusted as a bank	When Africans think about digital security, they think 'Tirenify'
A company 1,000 people work at	All African talent, building for Africa, getting paid well
Creating jobs and opportunities	Engineers in Nigeria, designers in South Africa, marketers in Kenya

The money would be nice. But it's not the point.

CLOSING

Simon Squibb asks young builders: 'What's your dream?' My dream is specific. It's real. It's: Tirenify. A security company for 1B+ Africans. Built in Africa. Built to last.

The product is live. My users are testing it. My vision is clear.

I'm building this regardless. Any investment, mentorship, or partnership doesn't create the mission. It simply allows me to move faster. The only question is: how fast?
